From Brand: Harvard School of Public Health : Global Burden of Disease: A comprehensive assessment of mortality and disability from diseases, injuries, and risk factors in 1990 and projected to 2020 (Global Burden of Disease and Injury Series) before purchasing it in order to gauge whether or not it would be worth my time, and all praised Global Burden of Disease: A comprehensive assessment of mortality and disability from diseases, injuries, and risk factors in 1990 and projected to 2020 (Global Burden of Disease and Injury Series):

0 of 1 people found the following review helpful. A very good ItemBy David Martinez BrisenoI think it is important to measure the satisfaction of the clients with this kind of polls. This procedures allow to know the quality of the books.

The Global Burden of Disease and Injury Series details and analyzes global patterns of death and disability, providing a bold, comprehensive examination of the state of the world's health. The Global Burden of Disease (GBD) provides systematic epidemiological estimates for an unprecedented 150 major health conditions. Its methods and results are presented here, including: disaggregated death and disability data; projections to the year 2020; and risk factor evaluations. While it minutely examines causes of death, the GBD is unique in its inclusion of disability. The authors explore the technical bases and moral implications of incorporating social, physical, and mental disabilities in health assessments, explicating the indicator they have developed, the disability-adjusted life-year (DALY). The GBD provides indispensable global and regional data for health planning, research, and education. Among the study's results: Depression was the fourth leading cause of disease-burden in 1990 and by 2020 will be the single leading cause. Injuries cause over 15 percent of death and disability. HIV will by 2010 inflict as great a burden as the age-old epidemic tuberculosis. By 2020, tobacco use will account for 9 million deaths annually. Ultimately, pneumonia and diarrhea, both primarily diseases of childhood, will continue to inflict the greatest health burden of all.

About the AuthorChristopher Murray is Associate Professor of International Health Economics at the Harvard School of Public Health. Alan Lopez is a scientist in the Programme on Substance Abuse at the World Health Organization, Geneva.
